Preparation-1

1. What is Java?

   Java is an object oriented, platform independent, case sensitive, strongly typed checking, high level, open source programming language developed by James Gosling in the year of 1995.

   Or

   Java is a versatile programming language that is used to develop various applications like standalone applications, desktop applications, business oriented applications, gaming applications, enterprise applications, networking applications and etc.

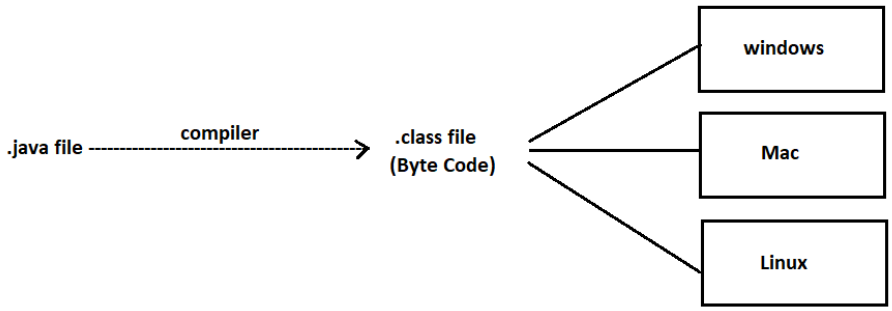

2. Features of Java?

   We have following list of important features in java.

   - Simple > Highly Secured
   - Object oriented > Dynamic and etc
   - Platform independent
   - Secure
   - Architecture Neutral
   - Robust
   - Portable
   - Multithreaded
   - High Performance
   - Distributed

3. Is java platform dependent or independent?

   Java is platform-independent at byte code level. When Java source code is compiled, it is converted into byte code and that byte code is executed by a Java Virtual Machine (JVM). A JVM is a software layer that is specific to each operating system (e.g., Windows, macOS, Linux).

4. Is java purely object oriented programing language?

   Java will not consider as purely object oriented programming language because it does not support many OOPS concepts like multiple inheritance, operator overloading, and more ever we depends upon primitive data types and static members which are non-object.

5. Is JVM platform dependent or independent?

   The JVM is platform-dependent because it's built for specific operating systems.
   Ex:
   Windows JVM, Linux JVM, Mac JVM.

6. What is identifier?

   A name given to program elements is called identifier.
   In general, identifier means a name given to variables, methods, classes, interfaces, packages and etc.

7. Write a simple Hello World Program in java?

```
class Test
{
        public static void main(String[] args)
        {
                System.out.println(“Hello World”);
        }
}
```

8. What is SDLC?

   It is a process adopt by IT industries to develop accurate and quality of software’s’.

9. How many phases are there in SDLC?

   There are six phases in SDLC.
   1. Feasibility study
   2. Analysis
   3. Designing
   4. Coding
   5. Testing
   6. Delivery and Maintenance
